Can cold weather affect battery power?

To limit the effects that the cold has on battery power, try to keep your device warm. You can do this by keeping your headlamp, smartphone, GPS or other gadget somewhere close to your body. Do not attempt to simultaneously recharge batteries of different capacities, different brands or different ages.

What type of battery should I use?

The most commonly used battery of all is an alkaline battery (meaning it contains an alkaline electrolyte, usually potassium hydroxide). Best use: "Low-drain" devices such as LED headlamps, LED flashlights, toys, remote control devices, clocks and radios, and even moderate-drain items such as lights using incandescent bulbs.

Can you put a battery in a fire?

Never put batteries into a fire. Doing so could cause them to rupture and spill their contents. Also: Avoid tossing them into a metal container where heat could build up. This battery guide lists pros and cons of the batteries (NiMHs, lithiums, alkalines and more) that power your outdoor devices.

What is a rechargeable battery?

Rechargeable Batteries: These batteries are built to be recharged over and over again, in some cases up to 500 times or more. The two main types of rechargeable batteries are nickel-metal hydride and lithium-ion. Pros: Because they're rechargeable, they generate less waste than single-use batteries.
