How can a low-carbon energy-gas-storage system improve energy storage performance?

A low-carbon layout of an integrated electricity-gas-storage system is proposed. Energy storage performance is enhanced by two-sided cascade energy integration. Carbon emissions are reduced through LNG-aided cryogenic desublimation. Cases optimized per criterion reveal distinct sustainability profiles.

Can a low-carbon energy storage system be based on LAEs?

The crucial roles of LAES and carbon capture technologies are addressed with a state-of-the-art literature review. The present study puts forward an innovative low-carbon configuration of an integrated electricity-gas-thermal energy storage system based on LAES, LNG regasification, and gas-fired combustion.
