The KA3525A is a monolithic integrated circuit that includes all of the control circuits necessary for a pulse width modulating regulator. There are a voltage reference, an error amplifier, a pulse width ...

Today I built a 50Hz oscillator circuit using the KA3525 IC to drive a high-frequency transformer and convert 12V DC into 220V AC.

Anyways, the input is around 60V DC and can supply 8Amps. I have attached a .pdf of an example Schematic that I made. The switching frequency should be adjustable from 45Khz to 70Khz.

The KA3525 is designed for high-frequency operation, enabling efficient power conversion and regulation. Its ability to work at high frequencies contributes to improved system performance and ...

To build an H-Bridged Inverter, you can use the TL494 or K3525 in a chopper circuit to get something in the neighborhood of 350V @ high frequency. You rectify its output to get clean ...

The KA3525A operates at fixed frequency, set by an external resistor and capacitor, and it includes features such as adjustable dead time control, soft-start circuitry.

This detailed guide will explore the components, working principles, and practical implementation of the KA3525 inverter circuit diagram to help you develop a robust inverter circuit.

ON Semiconductor offers a broad portfolio of power management, analog, and discrete semiconductors, including power MOSFETs, diodes, rectifiers, and voltage regulators, among others.

The document provides details on the pinout and functions of the KA3525 as well as an example application in a DC-DC converter circuit to generate 290V from a 12V supply using the IC.
