Does land-based solar-wind complementarity exist in 2021?

Conclusions This study evaluates global land-based solar-wind complementarity from 1950 to 2021 using high-resolution ERA5-Land data at 0.1°; 0.1°; (~9 km) resolution, mapping spatial patterns, long-term trends, and seasonal dynamics of solar power density (SPD) and wind power density (WPD) at 100 m hub height.

Which countries have synchronized solar and wind variability?

Central Africa and Southeast Asia show synchronized solar and wind variability. Seasonal shifts enhance complementarity in the Sahel during spring and autumn. Low-complementarity zones have expanded in parts of Australia over time. Regional patterns inform hybrid energy planning for land-based resource use.

What are the implications of k-means classification of global land-based solar-wind complementarity?

Table 1. Implications for regional energy systems derived from K-means classification of global land-based solar-wind complementarity over the period 1950-2021. Ideal for hybrid solar-wind systems; leverage seasonal offsets to minimize storage needs and ensure stable energy output.

Can ERA5-land data predict solar-wind complementarity over a decadal scale?

While this study effectively utilizes monthly averaged ERA5-Land data to assess solar-wind complementarity over decadal scales, its temporal resolution introduces certain limitations. Short-term fluctuations in SPD and WPD, such as diurnal cycles and wind gusts critical for hybrid system stability, are obscured.

The paper proposes a novel planning approach for optimal sizing of standalone photovoltaic-wind-diesel-battery power supply for mobile telephony base stations. The approach is ...

The spread use of both solar and wind energy could engender a complementarity behavior reducing their inherent and variable characteristics what would improve predictability and operability of the ...

Discover how solar energy is reshaping communication base stations by reducing energy costs, improving reliability, and boosting sustainability. Explore Huijue's solar solutions

# Swaziland Heavy Rain Communication Base Station Wind and Solar Complementarity

Swaziland Communication Green Base Station Scale Overview Are green cellular base stations sustainable? This study presents an overview of sustainable and green cellular base ...

Worldwide thousands of base stations provide relaying mobile phone signals. Every off-grid base station has a diesel generator up to 4 kW to provide electricity for the electronic equipment involved. The ...

Solar and wind resources vary across space and time, affecting the performance of renewable energy systems. Global land-based complementarity between these two resources from ...

A communication base station, wind-solar complementary technology, applied in the field of new energy communication, can solve the problems of inability to utilize wind energy to a greater extent, ...

Overview Solar and wind energy are universal natural resources, but also an inexhaustible source of renewable energy. Solar and wind have strong complementarity in time and ...

Analysis of the advantages of wind and solar complementarity in communication base stations Sep 08, 2025

The complementary role of wind and solar in communication base stations Hybrid energy solutions enable telecom base stations to run primarily on renewable energy sources, like solar and wind, with ...
