What is a cut-off voltage for a lithium ion battery?

Cut-off voltage is the recommended minimum voltage where a battery should stop discharging to prevent long-term damage. It is usually about 0.2V higher per cell than the absolute minimum voltage. For a 3S Li-ion battery pack, the recommended cut-off voltage would be 8.1V (2.7V  $\times$  3). Why Is Cut-Off Voltage Important?

What is the maximum discharge cut-off voltage for a battery?

The discharge cut-off voltage is typically around 3.0V - 3.3V per cell. When selecting a battery for any application, understanding its maximum continuous discharge current and discharge cut-off voltage is crucial. These parameters ensure the safe and optimal operation of the battery, preventing damage and extending its lifespan.

What is a cut-off voltage?

Cut-off voltage is the lowest voltage a battery cell should reach before it is considered discharged. Discharging below this level can lead to permanent damage, capacity loss, and battery failure. For a 3S Li-ion battery pack, the cut-off voltage would be 7.5V (2.5V  $\times$  3).

What happens if a battery exceeds the cut-off voltage?

The cut-off voltages are the guardrails that keep this system stable. Pushing a battery beyond these limits might offer a momentary gain in capacity but at a severe cost to its health and safety. Exceeding the Upper Limit (Overcharge): Forces excess lithium into the anode, causing metallic lithium plating (lithiation).
